## Butterfly scope(Beton SHimi)

### What is a butterfly scope?

I was responsible for the construction of internal walls in one of the company's projects. In this project, Hablex blocks were used. To connect the blocks together, we used a butterfly scope.

Propeller scoop is a type of metal fastener that is used to connect Hablex blocks to each other. These fasteners have high resistance and durability and make the walls built with Hablex blocks more resistant and stable.

### Technical specifications of the butterfly scope

Type:	Scoop
Color :	silver
Width:	20 mm
Thickness:	1 to 2 mm
product type :	stainless steel
Application :	stone-ceramic

### Installing the butterfly scope:

The steps to install the propeller scope are as follows:

#### Mark:

Mark the location of the scopes on the hublex blocks.

#### Drilling:

Using a suitable drill, drill holes at the marked locations.

#### Scope placement:

Insert the scoops through the holes into the Hublex blocks.

#### Connecting scopes:

Installing the butterfly scope is easy. Using a suitable drill, drill holes in the marked locations. Then, insert the scopes through the holes into the hublex blocks and connect them together. Propeller scopes are very strong and connect the blocks well. These fasteners increase the strength and durability of the walls. I was very satisfied with the use of the propeller scope. These fasteners are a practical and quality product that increase the quality of construction.
