Coverbelt (Beton Shimi)

Watertight bolt cover:

When concreting concrete walls, the molding process should be used according to the thickness and diameter of the wall. It is recommended to use screws, nuts and washers to control the concrete pressure during concreting and to prevent the mold connections from separating.

In systems such as pools, reservoirs, sediment traps, etc., sealing is important and sealing parts should be used.

For this reason, a waterproof belt cover is used. Otherwise, both repair and sealing will cost a lot. The function of the sealing belt cover is to protect and seal the bolts and other parts against water.

Coverbelt technical specifications

Product type:	Plastic
Color :	black-white
New A:	Sealing coverbelt
Diameter pipe :	25 mm

Types of waterproof bolt covers:

There are different types of watertight coverbolts and they are divided into three categories: plastic, metal or spring and cast iron coverbolts.

Application of cover belt:

Passing the billet through the concrete mold is used for the concrete walls of pools, water and sewage treatment plants, sources, reservoirs and similar structures.

Advantages of using plastic belt cover:

- .1 Reliable sealing
- .2 Long life span
- .3 Easy installation
- .4 Easy passage of the billet from the molding
- .5 Prevent damage to the belt
