Hablex block glue (Beton SHimi)

What is meant by Hablex glue?

It is a dry chemical compound that is mixed with water and creates a sticky, paste-like substance, which is now called block glue. Due to its unique composition, this material can create a very strong connection between the blocks, and for this reason, experts recommend using it for the Chinese wall.

Of course, we must mention that this category of materials is more suitable for autoclaved light blocks and they cannot be used for any type of block. The structure of these adhesives is such that it can make a connection 4 times stronger than cement. On the other hand, its final weight is very small and can greatly reduce the dead load of the building.

Technical specifications of Hablex block glue

physical state :	powdery
Color:	White-grey
packing:	20kg bags
Mixing ability:	has it
Chlorine ion:	does not have
Maintenance:	Protected from air and for one year

Features of Hablex block glue:

High adhesion: Hablex block glue has high adhesion to Hablex blocks. This glue makes the Hablex blocks firmly connected to each other and resists the incoming forces.

High resistance: Hablex block glue has high resistance to pressure, tension, and cutting. This glue makes the structures made with Hablex blocks strong and stable.

Insulation: Hablex block glue is thermal and sound insulation. This glue makes the structures made with Hablex blocks thermally and acoustically insulated.

How to use Hablex glue:

Add a bag of block glue little by little to 7 liters of water and mix. It should be noted that the work surface should be free of fat. (It is better to use a drill for mixing)
