## Tile glue (Beton SHimi)

### Powder tile adhesive:

Powder tile adhesive is a type of dry mortar that consists of cement, sand, additives and polymer resins. This type of glue is supplied in powder form and must be mixed with water for use.

#### Specifications of powder tile adhesive

physical state :	powdery
Color :	Gray
packing :	20 kg bags
Mixability:	has it
Chlorine ion:	does not have
Maintenance :	away from cold and heat in a closed bucket
net weight :	1/65gr/cm3

### Applications of powder tile adhesive:

Installation of various types of ceramic tiles on different surfaces such as concrete, cement, ceramic and stone

Installing ceramic tiles in wet environments such as bathrooms, toilets and swimming pools

Installation of ceramic tiles on the external facades of the building

Installation of antique ceramics and stone

Insulation and sealing of surfaces

### How to use powder tile adhesive BS600:

For a 20 kg bag, pour 5 liters of water into a large bucket and add the BS600 tile adhesive bag little by little and mix.

Be sure to do the mixing operation with the mixer, this will make the mixing speed and complete.

Put the prepared putty on the surface or back of the ceramic, it is recommended to use one liter of BS500 concrete adhesive in each bag of BS600 tile adhesive for slab stones and porcelain ceramics.

### Amount of powder tile adhesive BS600:

Depending on the surface of the work, usually about 4 to 5 kg of glue is used per square meter.
