## Parallel screw(Beton SHimi)

### What is a parallel screw?

The tile leveling screw is a practical tool that is used to install tiles on different surfaces. This screw consists of a screw piece and an adjusting piece.

Technical specifications of parallel screw	
product type:	Plastic
Color :	white
Height :	Depending on the type of infrastructure
Diameter :	Depending on the type of tile

### Advantages of tile flush screw:

**Easy to install:** The tile flush screw is easy to install. Just attach the screw piece to the substructure and then place the adjuster piece on the tile.

**Tile Leveler:** The tile leveler screw makes the tiles lie on a smooth and level surface. This makes the tiles look nice and neat.

**Save time and money:** Tile flush screws make tile installation faster and easier. This saves time and money.

The tile leveling screw is produced in different types, each of which is designed for a specific application. In general, screws can be categorized based on the type of substructure, the diameter of the tile, and the type of installation desired.

### How to use tile leveling screw:

To use a tile flush screw, you must first attach the screw piece to the substructure. Then, place the adjusting piece on the tile. Using a screwdriver, tighten the screw to secure the tile in place.
